Title: Daily Activities Recorder App

Objective

The objective of this lab is to develop a simple application that allows users to record their daily activities using Flutter. The app allows users to add daily activities by entering the activity name and information such as the time or category, and displays the recorded activities on the application interface.

Brief Description of the Application

The Daily Activities Recorder App is a simple activity recording application built using Flutter. It enables users to:

- Add new activities by inputting the activity name and its time or category
- View list of added activities
- Delete unwanted activities

The app uses a dynamic list (List<Activity>) to store daily activities and displays them using a ListView. When user adds or deletes an activity, the interface updates immediately using Flutter's setState() method.

Explanation of the Interface

The interface of the Daily Activities Recorder App is simple, clean, and user-friendly. The app interface consists of input fields, buttons, and a list display area.

1. Activity Name Input Field
    - This field allows the user to enter the name of the activity.
    - It uses a TextField widget controlled by the nameController.
    - The input is validated to ensure it is not empty before added to the list.

2. Activity Time / Category Input Field
   - This field is used to enter additional information for the activity entered in the Activity Name Input Field, which is the time or category of the activity to provide more context to the activity.
   - It uses a TextField widget controlled by the timeCategoryController.
   - The input is validated to ensure it is not empty before added to the list.

3. Add Activity Button
   - This button allows users to add a new activity to the list.
   - When clicked:
     - It checks whether both input fields are filled
     - Add the activity to the list
     - Clear all input fields
     - Display a confirmation message using a SnackBar.

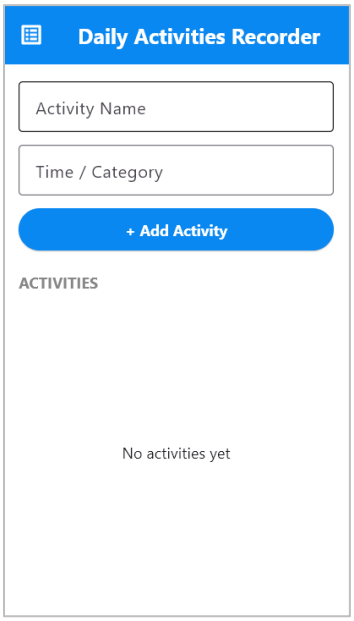
4. Activity List
   - Displays all added activities using a ListView.builder.
   - Each activity is shown inside a Card widget.
   - The list updates dynamically whenever a new activity is added or removed using the setState() method.

5. Delete Button
   - Each activity card contains a Delete button.
   - When clicked:
     - The selected activity is removed from the list
     - The interface updates immediately
     - A confirmation is displayed using a SnackBar.

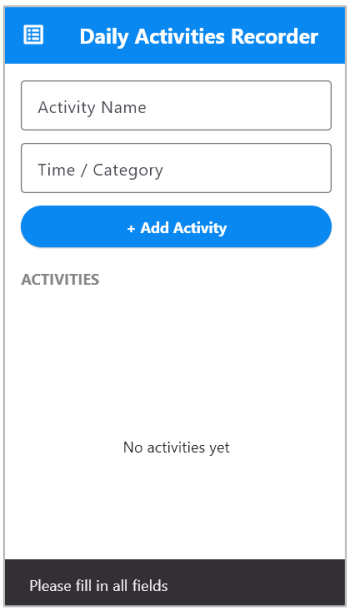
Screenshot of the App

This section shows the Daily Activities Recorder App's interface in different situations.

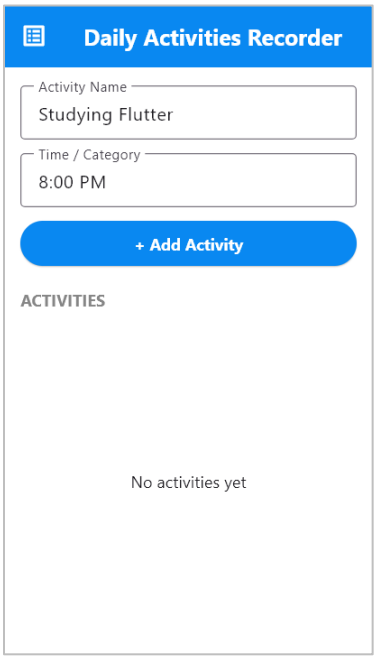
Main interface



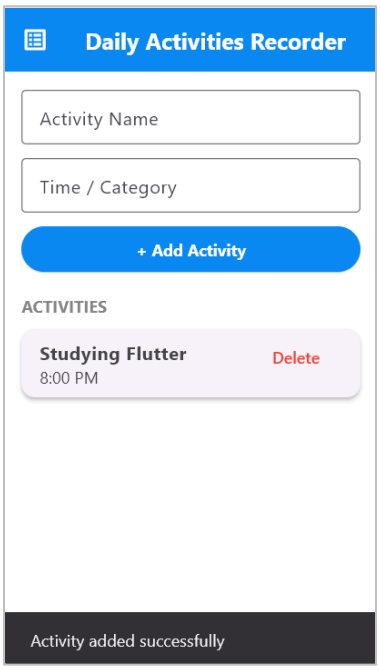
Adding an empty activity



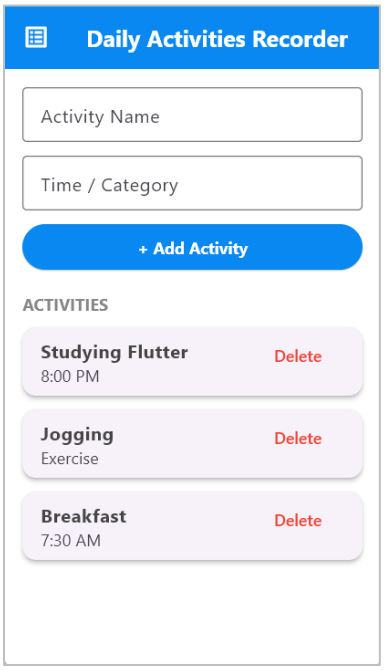
Adding an activity



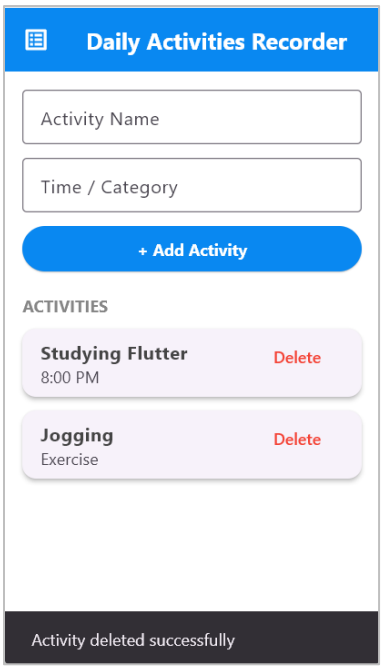
Activity added



Displayed activity list



Activity deleted



Conclusion

A functional Daily Activities Recorder App was developed successfully using Flutter. The application demonstrates key concepts such as user input handling, state management using the setState() method, dynamic list representation, and basic UI design using simple UI components such as card and button. This project provides a strong foundation for building more advanced applications in future.
